12 2 Practice Multiplying Rational This section explores several different approaches for multiplying two rational expressions stated as fractions. It includes opportunities to practice factoring rational expressions and to use the law of exponents to simplify rational expressions, and investigates how to determine which process to start with when multiplying two rational expressions in fraction form. Multiply the first expression by the reciprocal of the divisor. In other words, keep the first expression, change the operation from division to multiplication, and “flip” the second expression.

Section 2.2: Multiply and Divide Rational Expressions 12 2 Practice Multiplying Rational Expressions Answers 1 2 7 3 Multiply the numerators together and the denominators together 2 21 Our Answer When multiplying rational expressions, we first divide the numerators and denominators by any common factors. Then we multiply the remaining factors straight across. Example 2. Multiply. $\frac{24}{5x} \cdot \frac{87}{yx}$ Reduce coefficients by dividing out the common factors from the Section 2.2: Multiply and Divide Rational Expressions Multiplying and Dividing Rational Functions. The product and quotient of two rational functions can be simplified using the techniques described in this section. The restrictions to the domain of a product consist of the restrictions of each function. Example 12: Calculate $(f \cdot g)(x)$ and determine the restrictions to the domain. When multiplying with rational expressions we follow the same process, first divide out common factors, then multiply straight across. Example 2. $\frac{25x^2}{9y^8} \cdot \frac{24y^4}{55x^7}$ Reduce coefficients by dividing out common factors (3 and 5) Rational Expressions - Multiply & Divide Multiplying Rational Expressions Step 1. Factor each numerator and denominator completely into prime factors. Step 2. Cancel by dividing the
