Anatomy And Physiology Integumentary Sytem The integumentary system refers to the skin and its accessory structures, and it is responsible for much more than simply lending to your outward appearance. In the adult human body, the skin makes up about 16 percent of body weight and covers an area of 1.5 to 2 m². The Integumentary System | Anatomy and Physiology I The integumentary system has sensory receptors that can distinguish heat, cold, touch, pressure, and pain. Anatomy of the Integumentary System The skin and its derivatives (sweat and oil glands, hair and nails) serve a number of functions, mostly protective; together, these organs are called the integumentary system. Structure of the Skin Integumentary System Anatomy and Physiology - Nurseslabs The integumentary system includes the skin and the skin derivatives hair, nails, and glands. The integument is the body's largest organ and accounts for 15% of body weight. The derivatives of the integument: Hair: functions include protection & sensing light touch. Anatomy and Physiology - The Integumentary System In order to be considered closed, a wound has to have full re-epithelialization, defined as new skin growth, and no drainage or weeping from the pores. An appreciation for the anatomy and physiology of the integumentary system and the skin's role in healing is needed to understand wound closure, complete with optimal aesthetics and function.
