Anatomy And Physiology Urinary System Anatomy of the Urinary System. The urinary system consists of two kidneys, two ureters, a urinary bladder, and a urethra. The kidneys alone perform the functions just described and manufacture urine in the process, while the other organs of the urinary system provide temporary storage reservoirs for urine or serve as transportation channels to carry it from one body region to another. Urinary System Anatomy and Physiology: Study Guide for Nurses The organs of the urinary system include the kidneys, renal pelvis, ureters, bladder and urethra. The body takes nutrients from

food and converts them to energy. After the body has taken the food components that it needs, waste products are left behind in the bowel and in the blood. Anatomy of the Urinary System | Johns Hopkins Medicine The urinary system consists of the kidneys, ureters, urinary bladder, and urethra. The kidneys filter the blood to remove wastes and produce urine. The ureters, urinary bladder, and urethra together form the urinary tract, which acts as a plumbing system to drain urine from the kidneys, store it, and then release it during urination.
