Chemical Equations This is the most common type of
chemical equation. In this chemical equation, a new
product is formed by combining two to three
combinations of reactants. For instance, $H_2 + O_2 \rightarrow H_2O$.
This is a chemical equation where two atoms of
hydrogen are combined to form a product, water. This
is why this reaction is called as synthesis reaction. 49

Sometimes fuels contain oxygen atoms, which must be counted when balancing the chemical equation. Chemical Reactions and Equations - GitHub Pages Principles behind balancing chemical equations. Let's first state the key principles behind balancing chemical equations: 1. You cannot destroy atoms. The total number of atoms on each side of the equation must be the same. The number of atoms of each

element must therefore be the same on each side of the equation. 2. You cannot destroy charges Balancing chemical equations - chemistrytutor.me (2 marks)
