1. Convergent Evolution: If evolution is strongly directed by environment, then species in similar environments should evolve similar adaptation. Darwin observed this pattern.
2. Coevolution: Organisms are part of one another's environment so they can affect one another's evolution.

biorocks2dehsanderson.weebly.com Though Darwinian theory dramatically revolutionized biological understanding, its strictly biological focus has resulted in a widening conceptual gulf between the biological and physical sciences. In this paper we strive to extend and reformulate Darwinian theory in physicochemical terms so it can accommodate both animate and

inanimate systems, thereby helping to bridge this scientific divide. Toward a general theory of evolution: Extending Darwinian ... Darwin's theory of natural selection lacked an adequate account of inheritance, making it logically incomplete. We review the interaction between evolution and genetics, showing how, unlike Mendel, Darwin's lack of a model of the mechanism of inheritance left him unable to interpret his own data that showed Mendelian ratios, even though he shared with Mendel a more mathematical and ... Chapter 10 Bowler, who has written The Eclipse of
Darwinism: anti-Darwinian evolutionary theories in the
decades around 1900 (1983), has described a period

called the eclipse of Darwinism which discusses the state of affairs prior to the neo-Darwinian synthesis, when evolution was widely accepted in scientific circles, but relatively few biologists believed that natural selection was its primary mechanism. Non-Darwinian evolution - RationalWiki J. theor. Biol. (1979) 78, 573-591 Beyond neo-Darwinism-An Epigenetic Approach to Evolution M. W. Beyond neo-Darwinism—an

epigenetic approach to evolution ... The Neo-Darwinians then built their theory on random variation culled and directed by natural selection. They identified the heritable variations needed by the theory with the mutations discovered and named by De Vries some forty years earlier. Neo-Darwinism and the Age of Genetics - WindowView The Theory of Evolution by Natural Selection The theory of evolution by natural selection is a theory about the mechanism by which evolution occurred in the past, and is still occurring now. The basic theory was developed by both Darwin and Wallace, however, Darwin gave a much fuller argument. The theory states that biological change takes ... Darwin's Theory of Evolution by Natural

Selection The modern synthesis was the widely accepted early-20th-century synthesis reconciling Charles Darwin's theory of evolution by natural selection and Gregor Mendel's theory of genetics in a joint mathematical framework. It established evolution as biology's central paradigm. The 19th-century ideas of natural selection by Darwin and Mendelian genetics were united by researchers who included Ronald ... Extended evolutionary synthesis - Wikipedia Dietrich and Haider continue in a direction initiated by Campbell's (1960) blind variation and selective retention (BVSr) theory in which creativity is modeled as a Darwinian process. They deviate from Campbell in claiming that a Darwinian framework is appropriate

because creativity entails partial coupling of variation to selection. Toward an evolutionary-predictive foundation for ... Darwin's first reflections on human progress were prompted by his experiences in the slave-owning colony of Brazil, and by his encounters with the Yahgan peoples of Tierra del Fuego. Harsh conditions, privation, poor climate, bondage and servitude, could impede human progress or cause degeneration. In the "Fuegians", Darwin thought he had witnessed man in his most "primitive wildness" (letter ...
