Flight Dynamics. Aircraft and spacecraft fly in totally different environments, so they need different methods to direct their movement and to maintain their orientation. To provide stability and control, most airplanes use various control surfaces that work on the same principle as a wing, while spacecraft use thrust and spin. Airplanes are controlled along three axes: the longitudinal axis (front to back), the lateral axis (wingtip to wingtip), and the vertical axis (top to bottom). FLIGHTA. C. KERMODE MECHANICS The module provides students with an understanding of the principles of aircraft flight dynamics and the problems of controlling aircraft's motion. It introduces the equations of motion for a rigid body aircraft and the aerodynamic forces and moments are then determined. Static and dynamic stability, response characteristics are defined and methods for their analysis are next introduced. ACS6411 Flight Dynamics and Control - Modules 2018-19 ... Flight dynamics is the study of the performance, stability, and control of vehicles flying through the air or in outer space. It is concerned with how forces acting on the vehicle influence its speed and attitude with respect to time. For a fixed-wing aircraft, its changing orientation with respect to the local air flow is represented by two critical angles, the angle of attack of the wing and the angle of attack of the vertical tail, known as the sideslip angle. A sideslip angle will arise if a
