It is a container fitted with a piston, where the fuel is burnt and power is produced. Cylinder is the main body of the IC engine. Cylinder is a part in which the intake of fuel, compression of fuel and burning of fuel take place. The main function of the cylinder is to guide the piston. For cooling of the cylinder a water jacket (for liquid cooling used in most cars) or fin (for air cooling used in most of the bikes) is situated at the outer side

of the cylinder. IC engine Major Parts and Its Function, Materials, Images ... Internal combustion engines can contain any number of combustion chambers (cylinders), with numbers between one and twelve being common, though as many as 36 (Lycoming R-7755) have been used. Having more cylinders in an engine yields two potential benefits: first, the engine can have a larger displacement with smaller individual reciprocating masses, that is, the mass of each piston can be less ...
