Many high-performance, single-engine turboprop pilots believe the long-held myth their aircraft burns two-thirds of the fuel of a jet just to go 20 knots slower. But the truth is it's more like 45 knots - making it to destinations 12 and 14 percent

faster than the turboprop. High-performance turboprops vs. light jets Engines used in the earlier parts of 20th century had deficiencies in spite of their advantages. The advantages used in those times were Turboprop engines. These engines could produce only 10% of their thrust from the exhaust jet. They could not attain high speed. Researches were conducted further, which led to the developments of Turbofan engines.
