The empty set and are in the collection because their complements are and the empty set, the complement of any union of open sets is the intersection of the countable complements of these sets, so it is countable as well, finally, the complement of the finite intersection of open sets is the union of the countable complements, so it is countable. This is also called the first homotopy group of X ; For a path connected space (or for a path connected component of a space) the choice of the point is not important: if X is path connected, then $\pi_1(X, x_0)$ is isomorphic to $\pi_1(X, x_1)$. To show this, for a
